

**MACHINE FOR MOWING STALK-LIKE CROPS AND REMOVER THAT CAN BE
DISASSEMBLED**

Abstract of the Disclosure

A machine for mowing stalk-like crops includes a plurality of intake and mowing arrangements which each include a cutting disk and a plurality of conveying disks spaced vertically from each other along an upright axis of rotation. A plurality of strippers are mounted in the vicinity of the intake and mowing arrangements and define slots through which driver elements of the conveying disks pass during operation. Crop pieces accumulate in these slots and provided on the drivers of the disks for sweeping these crop pieces out of the slots are removers. These removers are in the form of elongate bars and are connected to the disks so as to be easily removable so that they may be easily replaced when worn to the extent they are no longer effective in cleaning the crop pieces from the stripper slots.
